

At Phase 3 we believe that the future of the communications industry begins with the development of dependable underground infrastructure capable of supporting intricate fiber optics systems. We have built a team of highly trained construction tradesmen with a focus on the restoration and relocation of highly sensitive “live” fiber optic networks in some of California’s most demanding markets.

Our Construction department is led by qualified project managers and skilled personnel with nearly 20 years of experience in all aspects of underground construction; including concrete coring, trenching, rock sawing, directional boring, fiber placement, and surface restoration.

We offer fast and efficient solutions to even the most challenging underground construction and aerial telecommunications projects, and we pride ourselves on having the ability to perform quality service on time and within budget.
